

The Mu3e experiment

Frederik Wauters on behalf of the Mu3e Collaboration

Johannes Gutenberg University Mainz

CLFV & $\mu^+ \rightarrow e^+ e^+ e^-$

Search for Charged Lepton Flavour Violating \subset New Physics in the Lepton Sector \subset Beyond Standard Model Physics
@ precision / intensity frontier

- Lepton Flavour is an *accidental* SM symmetry
- In the neutral/neutrino sector, Lepton Flavour Violation is experimentally observed \rightarrow SM extended with PMNS 
- Many new Physics Models $\begin{matrix} \text{Leptoquarks} \\ \text{SUSY} \\ \text{Z}' \\ \text{Composite Higgs} \\ \dots \end{matrix}$ predict CLFV, in an EFT framework sensitive many operators at a mass scale beyond LHC

For example, a systematic effective-field-theory approach presented in [arXiv:1702.03020v3](https://arxiv.org/abs/1702.03020v3)

Sensitive to $\Lambda > 1000 \text{ TeV}$ energy scales

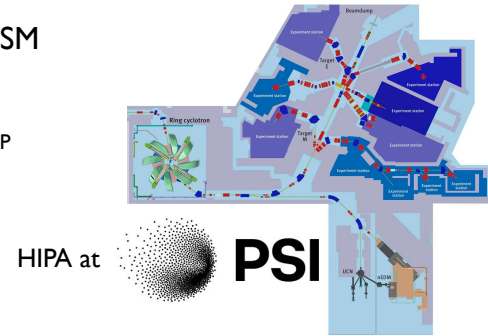

is it "boring BSM" or "interesting BSM"?

CLFV & $\mu^+ \rightarrow e^+ e^+ e^-$

Muons are great for CLFV:

- They are leptons with 100% leptonic decay modes very well described in the SM
- SM background free
- BSM contributions can be described by EFT [arXiv:1702.03020](https://arxiv.org/abs/1702.03020) as $m_{\mu} \ll \Lambda_{\text{NP}}$
- **We can make a lot of them at p-accelerator facilities**
- **They live long enough to production \rightarrow experiment**

Three golden channels

❑ $\mu^+ \rightarrow e^+ \gamma$	MEG < $4 \cdot 10^{-13}$	\Rightarrow	MEGII < $5 \cdot 10^{-14}$
❑ $\mu^- N \rightarrow e^- N$	SUNDRUMII < $7 \cdot 10^{-13}$	\Rightarrow	DeeMee, Mu2e, COMET < 10^{-16}
❑ $\mu^+ \rightarrow e^+ e^+ e^-$	SINDRUM < $1 \cdot 10^{-12}$	\Rightarrow	Mu3e < $2 \cdot 10^{-15}$ ($1 \cdot 10^{-16}$ in a second phase)

CLFV & $\mu^+ \rightarrow e^+ e^+ e^-$

How to look for $\mu^+ \rightarrow e^+ e^+ e^-$?

3 particle decay at rest

- Common vertex
- Time coincident
- $\sum E = m_\mu$
- $\sum \mathbf{p} = 0$

CLFV & $\mu^+ \rightarrow e^+ e^+ e^-$

How to look for $\mu^+ \rightarrow e^+ e^+ e^-$?

DC Beam @ PSI

3 particle decay at rest

- Common vertex
- Time coincident
- $\sum E = m_\mu$
- $\sum \mathbf{p} = 0$

2 particle decay at rest, very clear signal

- Mono-energetic e^+ and γ
- back-back coincidence

Pulsed beam at FNAL, J-PARC

Only one particle in final state

- Mono-energetic e^-
- No coincidence

CLFV & $\mu^+ \rightarrow e^+ e^+ e^-$

How to look for $\mu^+ \rightarrow e^+ e^+ e^-$?

3 particle decay at rest

- Common vertex
- Time coincident
- $\sum E = m_\mu$
- $\sum \mathbf{p} = 0$

Accidental Background

Internal conversion

The Mu3e apparatus needs:

- Excellent momentum resolution
- Good time and vertex resolution
- High rate capability
- Large acceptance

Mu3e detector concept

- Stop muons on hollow cone target

Mu3e detector concept

- Stop muons on hollow cone target
- Two layer Vertex Detector + 2 Outer Pixel layers
- Two more Si Pixel layers tracking (see our dedicated fast track fitter: <https://arxiv.org/abs/1606.04990>)
- Scintillating Fibre detectors to differentiate electrons and positrons

Mu3e detector concept

- Stop muons on hollow cone target
- Two layer Vertex Detector + 2 Outer Pixel layers
- Two more Si Pixel layers tracking (dedicated fast track fitter: <https://arxiv.org/abs/1606.04990>)
- Scintillating Fibre detectors to differentiate electrons and positrons
- Recurling tracks to get the optimal momentum resolution
- Scintillating Tiles to get the optimal time resolution

Momentum resolution dominated by multiple scattering
 → Ultra-thin Si pixel tracker, θ (0.1% X_0),
 with decent time resolution, θ (10 ns)

HV-MAPS pixel tracker

Lightweight pixel tracker build from MuPIX sensors*

- ❑ Commercial HV-CMOS process
- ❑ Fast Charge collection
- ❑ Integrated analogue and digital RO, 1.25 Gb LVDS link
- ❑ Can be thinned to 50 μm
- ❑ 256x250 pixels, 2 x 2 cm matrix

10 years of R&D

MuPiX11 sensor up to specs*

HV-MAPS pixel tracker

Lightweight pixel tracker build from MuPIX sensors*

- ❑ Commercial HV-CMOS process
- ❑ Fast Charge collection
- ❑ Integrated analogue and digital RO, 1.25 Gb LVDS link
- ❑ Can be thinned to 50 μm
- ❑ 256x250 pixels, 2 x 2 cm matrix
- ❑ 174 ladders with 2844 2x2 cm² MuPiX chips
- ❑ 2 Vertex layers
- ❑ 3 x 2 Outer Pixel layers
- ❑ 3060 1.25 Gb/s data links
- ❑ 50 g/s, 10m/s 5kV gaseous helium cooling

Scintillating fibres and tiles

The Mu3e Scintillating Fiber Detector

Gentian Shatri

Scintillator fibres and tile detector readout by MuTRiG ASIC**

- ❑ Improve timing from 10-20 ns to 250 ps and 80 ps, respectively
- ❑ Resolve tracking ambiguities, deal with pile-up
- ❑ Differentiate between e^+ & e^-
- ❑ Thin 3-layer SciFi ribbons at < p.e.Threshold
 - ❑ Low mass
 - ❑ Efficient
 - ❑ Decent time resolution

Fibre ribbon

- ❑ Upstream and Downstream tile station
- ❑ End of a track \rightarrow Scintillating cubes for optimal time resolution

- ❑ Custom MuTRiG readout chip**
 - ❑ 50 ps TDC
 - ❑ High rate
 - ❑ 1.25 Gb/s readout link

Tile Matrix

Central SciFi Tracker*

US & DS Tile Stations

Mu3e detector design

Compact lightweight
electron-positron tracker

Mu3e detector design

Compact lightweight electron-positron tracker **plus**

- ❑ Power, HV, and front-end readout services at the end-caps
- ❑ $<10^\circ\text{C}$ liquid SiPM cooling
- ❑ Ca. 5kW gaseous helium for the pixel detector
- ❑ Streaming $>100\text{ Gb/s}$ streaming DAQ + online GPU event selection

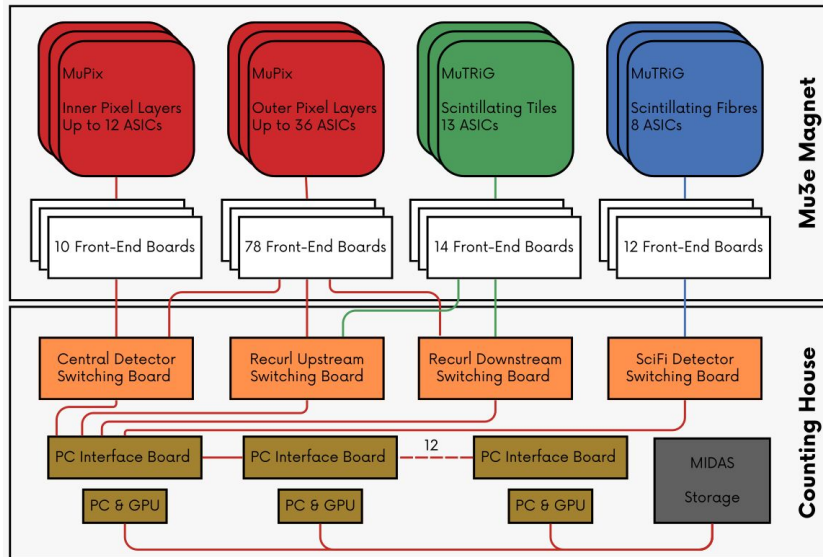

- Common vertex
- Time coincident
- $\sum E = m_\mu$
- $\sum p = 0$

Mu3e DAQ

Reminder: the Mu3e event topology does not allow for a local readout trigger, every $e^{+/-}$ track could potentially be part of a $\mu^+ \rightarrow e^+ e^+ e^-$ event. Only the kinematics of the combined final state positrons/electron gives us an event selection criteria.

*Mu3e = lightweight and fast Michel electron tracker + high throughput online reconstruction & selection DAQ system**

- ❑ Streaming DAQ
- ❑ Network of FPGA's and optical connections
- ❑ Collect time slices of the full detector on a single PC
- ❑ Online reconstruction and event selection on a GPUs
- ❑ Write selected events to disk at max 100 MB/s (up to 100x reduction)

Custom readout board electronics
inside the magnet

On-the-shelf solutions in the
counting house

Mu3e = running experiment at PSI

1.5 year ago:

- ❑ Detector modules in (pre)production
- ❑ Commissioned magnet + beamline
- ❑ Empty detector cage

The Mu3e Commissioning Run at PSI in 2025

Mikio Sakurai

June 2025: successful first Mu3e
commissioning beamtime in $\pi E5$

Mu3e = running experiment at PSI

1.5 year ago:

- ❑ Detector modules in (pre)production
- ❑ Commissioned magnet + beamline
- ❑ Empty detector cage

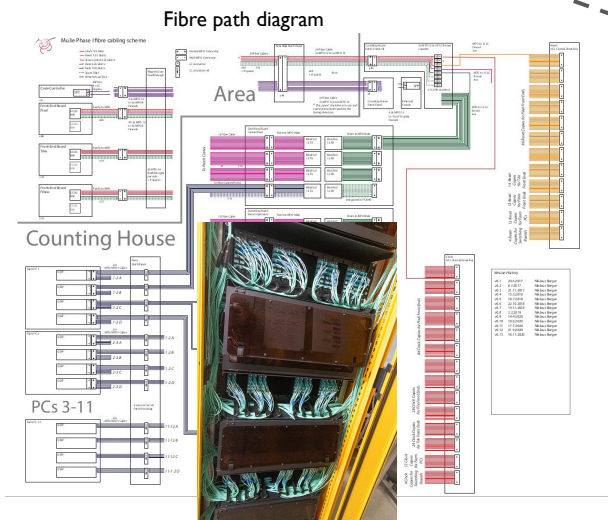

Install DAQ hardware:

- Service support wheels with front-end FPGA boards
- Optical fibre network, including data merging
- Online GPU filter farm

Data merging and construct time slices of the full detector

Plus combining a lot of **firmware** and **software** achieve a complete data path

Datapath on a GPU farm node

Mu3e = running experiment at PSI

1.5 year ago:

- ❑ Detector modules in (pre)production
- ❑ Commissioned magnet + beamline
- ❑ Empty detector cage

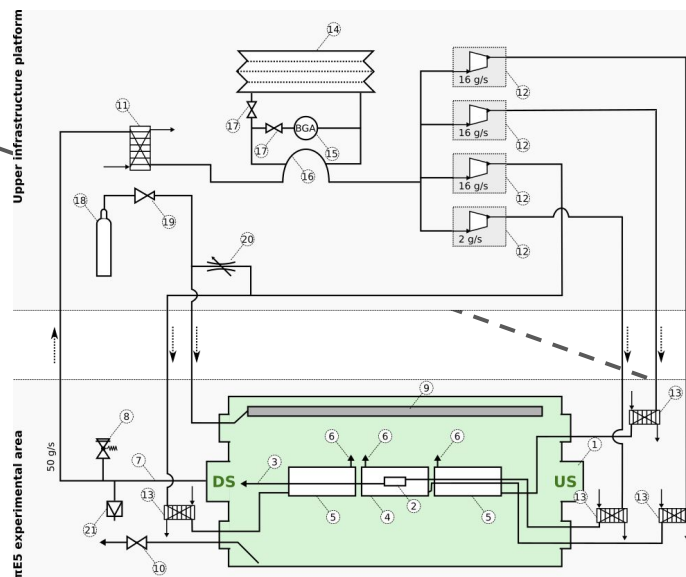

Power system with custom DC-DC converters

Install Power and cooling plants

- Power supplies, DC-DC converters, electrical wiring
- Electronic cooling plant
- <10C silicon oil based detector cooling (SiPM radiation damage)
- Novel gaseous helium plant

Mu3e = running experiment at PSI

1.5 year ago:

- ❑ Detector modules in (pre)production
- ❑ Commissioned magnet + beamline
- ❑ Empty detector cage

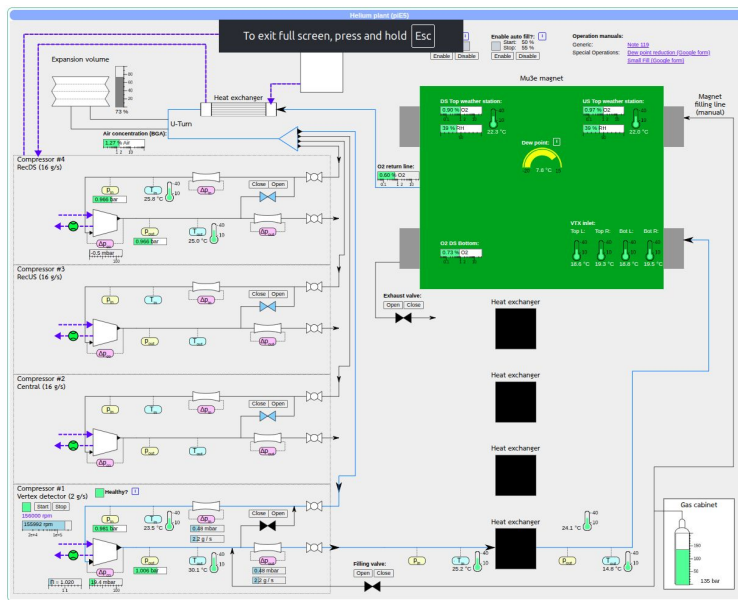

Power system with custom DC-DC converters

Install Power and cooling plants

- Power supplies, DC-DC converters, electrical wiring
- Electronic cooling plant
- <10C silicon oil based detector cooling (SiPM radiation damage)
- Novel gaseous helium plant, > 10m³/min

Significant infrastructure installation in PIE5

Mu3e = running experiment at PSI

1.5 year ago:

- ❑ Detector modules in (pre)production
- ❑ Commissioned magnet + beamline
- ❑ Empty detector cage

Install Detector modules

- Micro twisted-pair bundles to get data out to the periphery
- Full MuPIXII based Vertex v1
- One SciFi and 3 Tile modules

Tile modules

Vertex detector

SciFi Modules

Mu3e = running experiment at PSI

The *flight* of Mu3e

Three week long Mu3e commissioning beamtime

- ❑ Tune and operate pixel (vertex), scintillating fibre and tile detector with beam
- ❑ DAQ and DQM commissioning, full datapath readout system
- ❑ $\pi E5$ services commissioned
- ❑ Stress test system $> 10^7 \mu/s$
- ❑ Running online GPU selection

Towards physics

Mu3e Phase I aims for a $\mu^+ \rightarrow e^+ e^+ e^-$ S.E.S. of $2 \cdot 10^{-15}$. Next steps

- Investigate and fix all failure modes observed in 2025
- Construct Vertex v2 = 
- Outer pixel production.
 - ❑ 6 → 18 chips per ladder
 - ❑ 18 → 156 ladders

Towards physics

Mu3e Phase I aims for a $\mu^+ \rightarrow e^+ e^+ e^-$ S.E.S. of $2 \cdot 10^{-15}$. Next steps

→ Investigate and fix all failure modes observed in 2025

→ Construct Vertex v2 = 

→ Outer pixel production.

❑ 6 → 18 chips per ladder

❑ 18 → 156 ladders

→ Aim for central detector = first physics

before the 2027 HIPA shutdown

→ Mu3e Phase II at HIMB →

❑ Need additional fast pixel layer (+ other stuff)

❑ Aim for $\mu^+ \rightarrow e^+ e^+ e^-$ S.E.S. of $1 \cdot 10^{-16}$

Sort in Time

Time synchronization

Group detectors

Mupix11 Quad Module

- Module with large active sensor area for beam monitoring and μ SR detector prototype

Specifications:

- 2×2 grid of $50 \mu\text{m}$ **Mupix11** sensors
- $25 \mu\text{m}$ Kapton foil for structural support
- Active area: $40 \times 40 \text{ mm}^2$
- Sensor spacing: $200 \mu\text{m}$

Production:

Sensor alignment

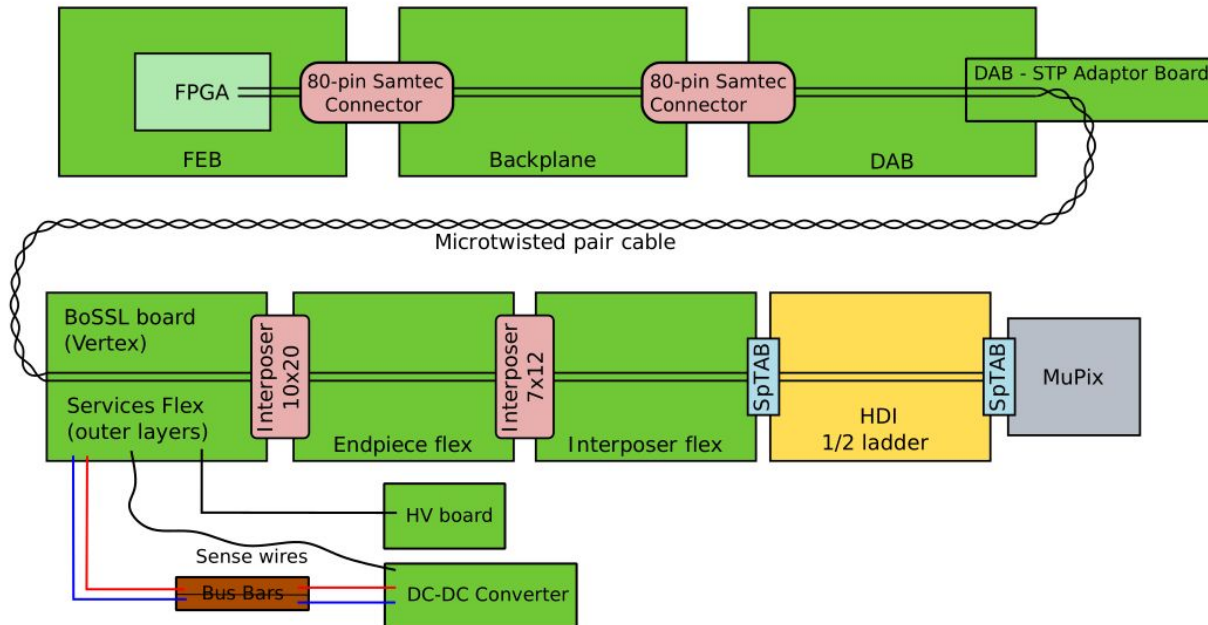

Sensor gluing

DAQ:

- Minimal, Mu3e compatible DAQ setup
- Optional scintillator input for improved timing

3 particle decay at rest

- Common vertex
- Time coincident
- $\sum E = m_\mu$
- $\sum \mathbf{p} = 0$

If we see a few events, we are sensitive to the type of NP interaction
