2005

Outline

- Security of energy supply and climate change
- The energy-system ERIS model
- Global oil resources
- Combining policies
- Some results
- Conclusions

Combining Security of Energy Supply and Climate Change Policies

- Climate change and energy supply disruptions are major risks linked to the energy system
- Both are important to long-term sustainability and are affected by technological change
- There may be synergies and trade-offs between pursuing GHG abatement and security of energy supply

Synergies and Trade-offs

- Synergies occur when actions are common to the two policy objectives
- Trade-offs occur when the best ways to achieve the two policy objectives separately are very different
- When synergies exist, the costs of combined policies may be lower than the summation of the costs of separate policies

The Energy-System ERIS Model

- ERIS (Energy Research and Investment Strategy), developed at PSI and IIASA
- “Bottom-up” energy-systems model with electric, non-electric and transport sectors
- Emissions and marginal abatement curves for $\text{CH}_4, \text{N}_2\text{O}$
- Clusters approach to endogenize technological learning
- Global, 11-region model (following MESSAGE model)
- Calibrated to year-2000 statistics

Resource Classification

Category	Description
I	Proven reserves
II	Estimated additional reserves
III	Additional resources (50%)
IV	Enhanced recovery
V	Proven reserves
VI	Additional resources
	Other occurrences

Conventional { I, II, III, IV }

Unconventional { V, VI }

- Oil shales, tarsands, heavy crudes
- Coal-seam methane, geopressured gas, tight formation, methane hydrates

Global Oil Resources

Resources to Consumption Ratio

- The number of years that domestic resources can support current domestic consumption
- Similar to R:P (Resources/Production), but incorporates physical import dependence

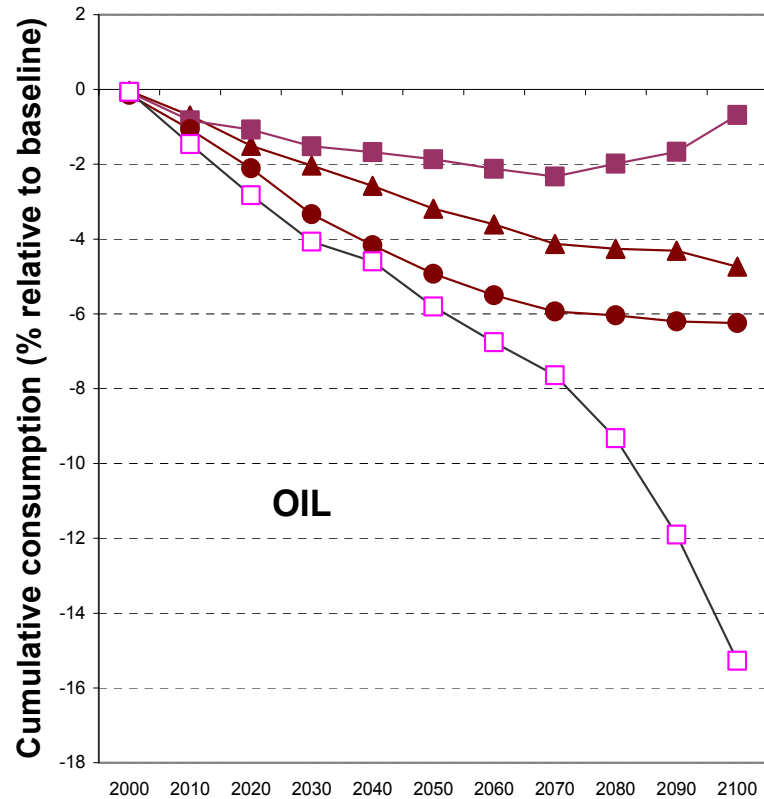

$$\frac{R}{C} = \frac{R}{P} \bullet \frac{P}{P + \text{Net imports}}$$

- Indicates long-term ability to maintain domestic supply when facing disruptions to energy availability

Security of Energy Supply and Climate Change Policies

- Security of energy supply policy (applied in NAM, WEU, EEU, PAO and CPA)
 - Maintain R:C ratio above 20 years
 - Maintain viable extraction industry
 - 25% of total supply obtained domestically until 2050
- Two climate change policies
 1. Weak – emissions trajectory ~ \$75/t C-e
 2. Strong – 650 ppmv CO₂

Impact on Oil and Gas Consumption

▲ Supply policy
 ■ Weak GHG cap
 ● Supply policy and weak GHG cap
 □ 650 ppmv GHG cap

Impact of Policies on GHG Emissions (relative to baseline)

Impact of Policies on Global H₂ Production

Policy Impact on Energy System Cost

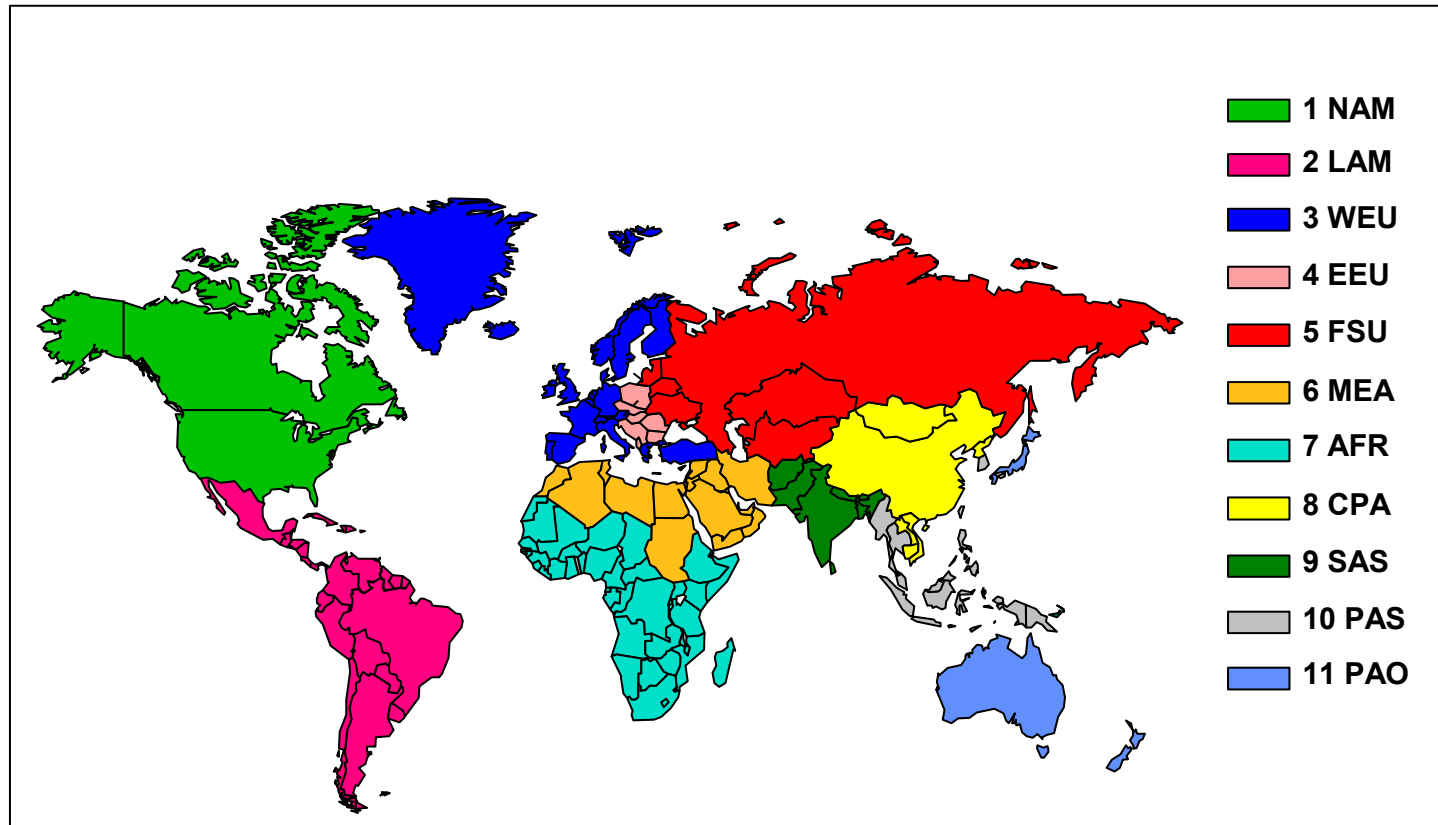

Conclusions

- There are synergies and trade-offs between climate change and security of energy supply
- They depend, among others, on the stringency of the climate policy.
- A strong climate policy could achieve security-of-supply objectives. Synergies with a less stringent climate policy are much weaker
- Supporting energy technologies that fulfill a policy objective in isolation could decrease flexibility to respond to other policy goals

Support Slides

Eleven World Regions in the ERIS Model

1 NAM North America

2 LAM Latin America & The Caribbean

3 WEU Western Europe

4 EEU Central & Eastern Europe

5 FSU Former Soviet Union

6 MEA Middle East & North Africa

7 AFR Sub-Saharan Africa

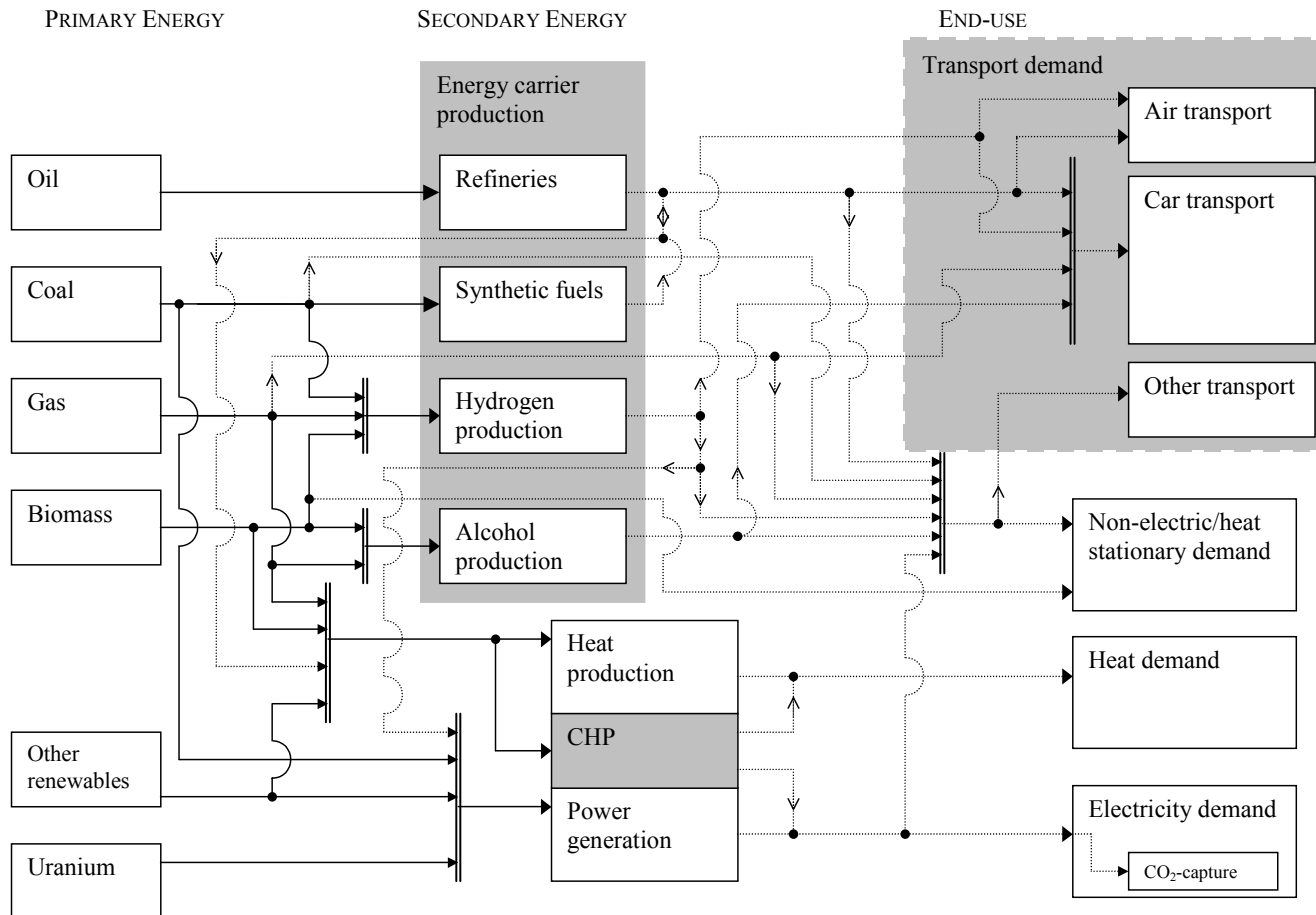

8 CPA Centrally Planned Asia & China

9 SAS South Asia

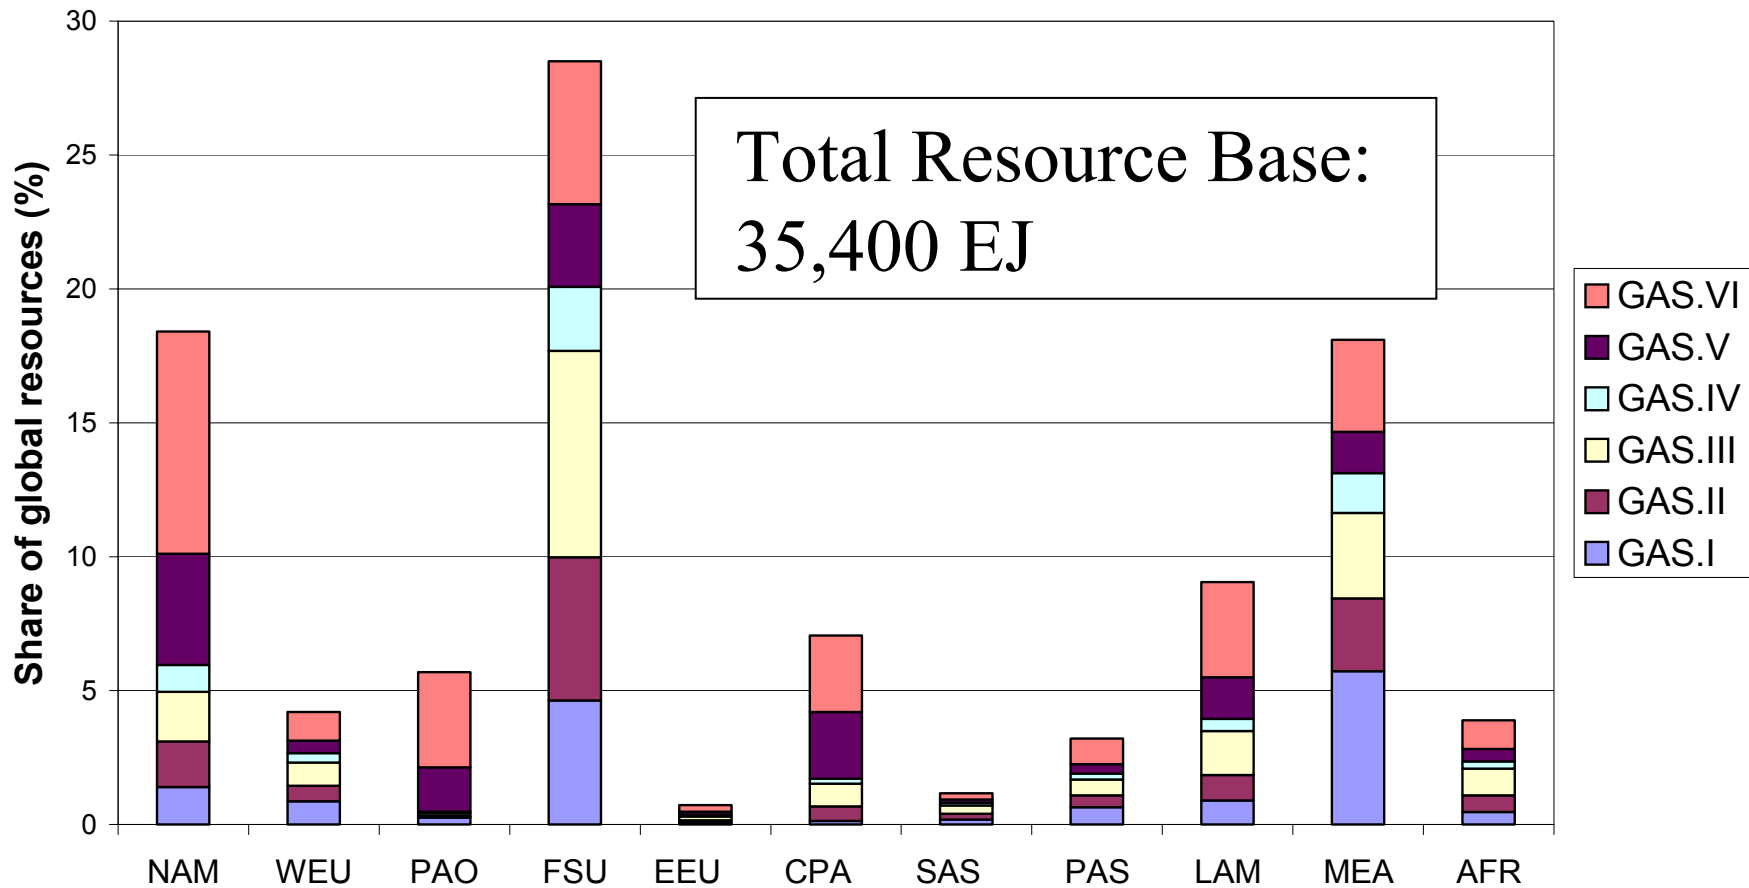

10 PAS Other Pacific Asia

11 PAO Pacific OECD

The ERIS Model: Reference Energy System

Global Gas Resources

Some illustrative R:P and R:C for oil in 2000

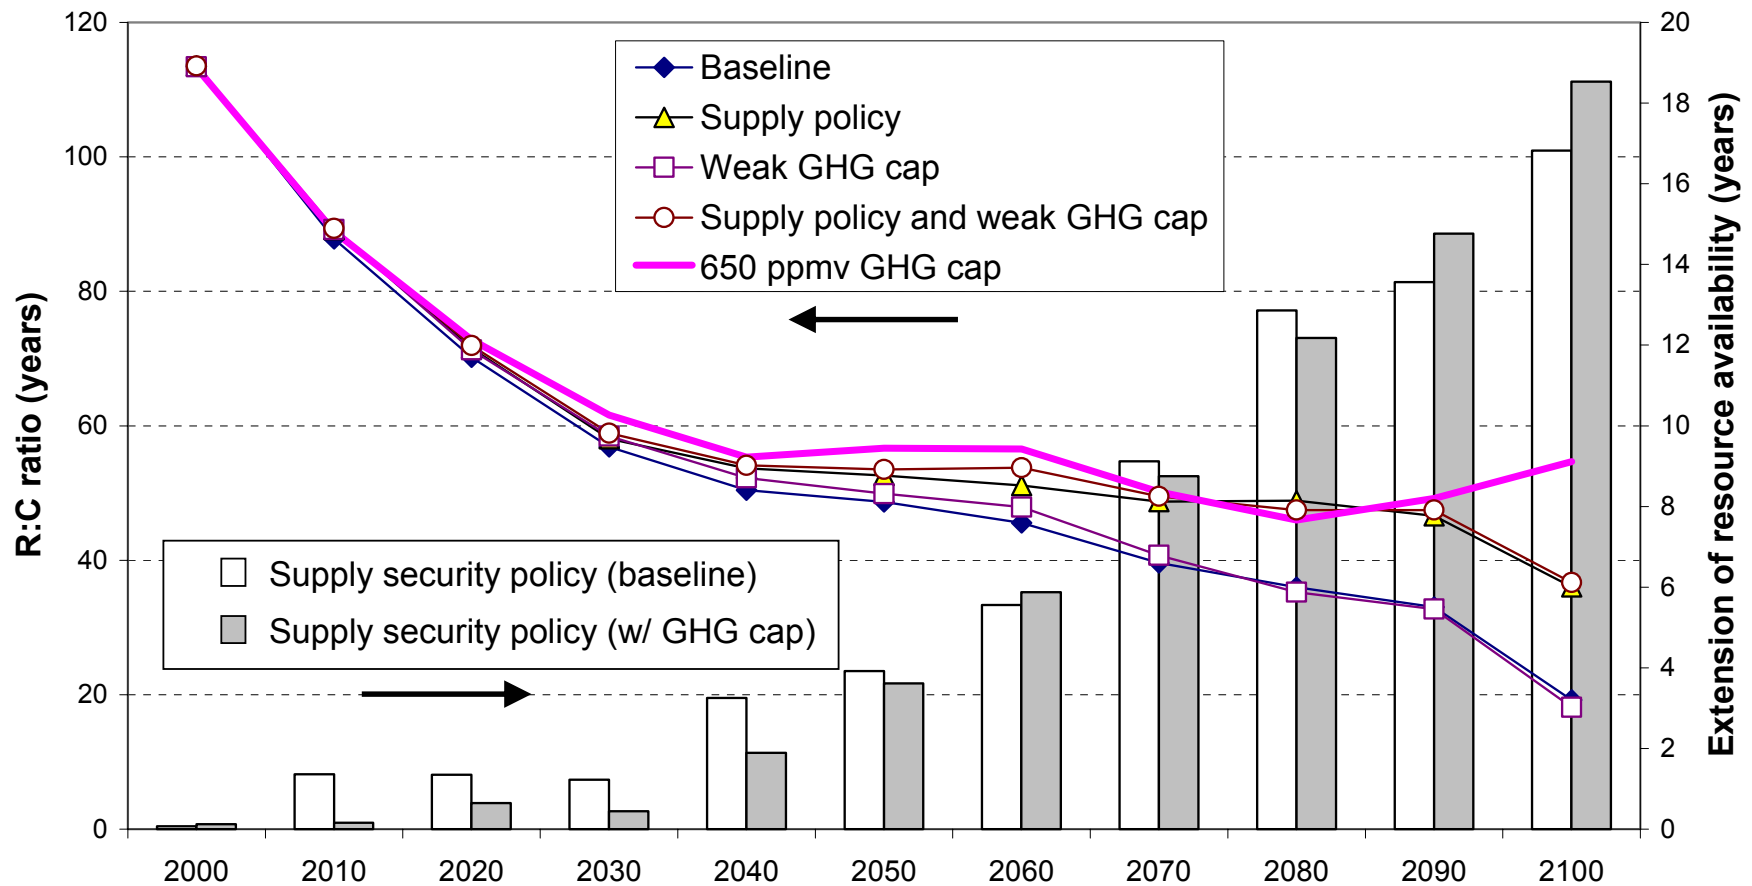

Primary Energy Consumption: Baseline

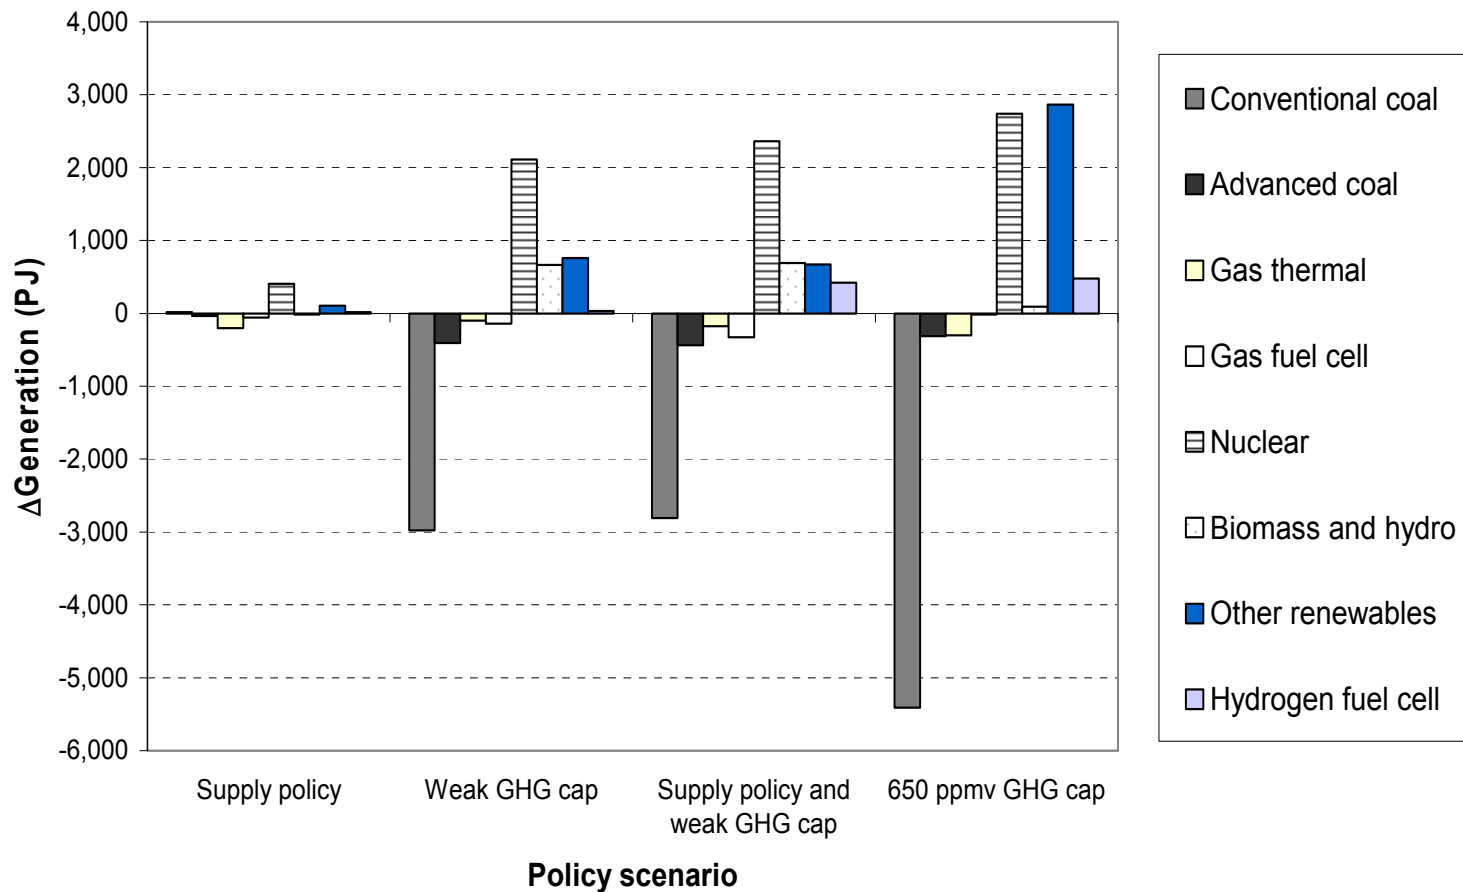

Global Electricity Generation: Baseline

R:C (Oil) for 5 Regions

Impact of Policies on Electricity Generation

Hydrogen Production

- Baseline: Mainly coal-based hydrogen
- Supply security: Increase, coal-based hydrogen
- Weak GHG target: Decrease, coal-based hydrogen is discouraged
- Combined supply security + weak GHG target: Increase, carbon-based hydrogen + CO₂ capture
- Strong GHG target: Shift towards carbon-free hydrogen and carbon-based hydrogen+CO₂ capture

Impact of Technology Policies
