Why Microalgae?

- The production of liquid biofuels from food crops such as corn, soya, and sugarcane are in direct competition with food production for human consumption.
- In contrast, microalgae grown in photobioreactors, offer the following advantages:
- Microalgae are the most productive photosynthetic organisms on earth and grow several times faster than other energy crops.
- They can grow in reactors on non-fertile land, thus not competing with food production.
- They require less water for growth than land cultivated crops.
- They can directly convert industrial CO₂ emissions into organic matter.

Why Bio-Synthetic Natural Gas?

- Wet biomass feedstocks can efficiently be converted into Bio-Synthetic Natural Gas (Bio-SNG) through catalytic hydrothermal gasification. The major advantages are:
- Bio-SNG can be used in the existing infrastructure (natural gas grid).
- It can be sold as transportation fuel in the form of natural compressed gas.
- Technology with high efficiency for power production is available (CHP).
- No biomass drying or product distillation steps are necessary.

SunChem Process: Closed-Loop System with Respect to Nutrients

4. The recovered nutrients and water are

The Hydrothermal Laboratory Plant

- 1 kg feed stream per hour
- Concentrations up to 20 wt % organic material
- Operated almost fully by remote control
- The rig consists of three sections:
 - Preheating
 - Salt separation
 - Fixed bed catalytic reactor
- In order to remove the nutrients quantitatively, the salt separator is the hottest part of the rig

Conclusions

- If proved feasible, SunChem is an innovative way to produce renewable transportation fuel and power.
- Nutrients can be recovered from the microalgae feedstock in the form of a concentrated salt brine.
- Microalgae can be produced at high specific rates in photobioreactors, surpassing the area yield of crops and other plants.
- Technical challenges such as the coupling of the biological process with the hydrothermal process need to be tackled in the future.
- The economic feasibility of the SunChem process has to be assessed and demonstrated.
