CIEMAT's MELCOR Modeling Activities during 2014

C. López, J. Fontanet, E. Fernández, L.E. Herranz

***Unit of Nuclear Safety Research
CIEMAT, SPAIN***

- Contents: 1. Background & recent activities***
- 2. Modeling Core***
- 3. Modeling PCV***
- 4. Numerical items***

Unit of Nuclear Safety Research

Belgium, March 17-18,2015

1. Background and recent activities:

		LWR	SFR
M.1.8.6	In-containment source-term and thermal-hydraulics	Phebus-FP project FPT1 FPT2 tests	CP-ESFR ABCOVE tests
	Fuel degradation in the presence of air	OECD-SFP project	↑ ASTEC
M.1.8.6 M.2.1	Input updating Sequence analysis	BWR (CSN) PWR (CSN)	← MAAP →
M.2.1	Plant modeling Sequence analysis Validation	BSAF project (CSN) 1F1; 1F2; 1F3	

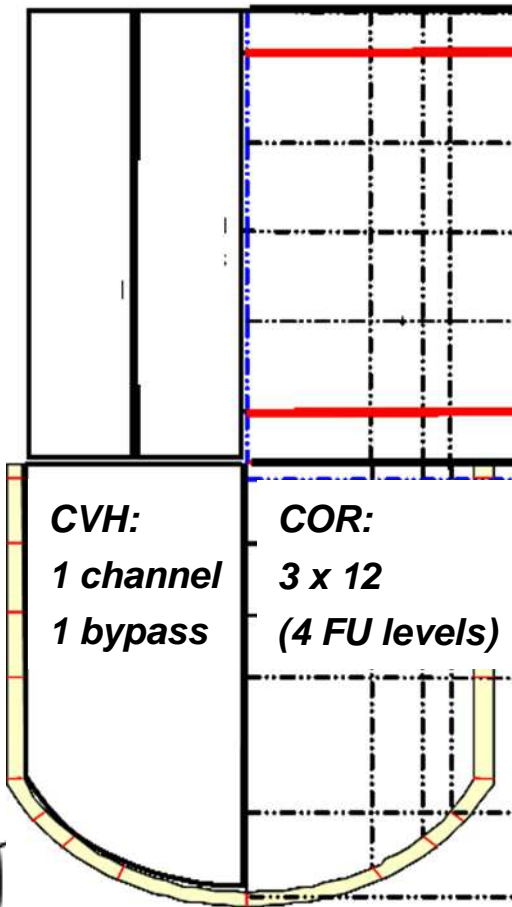

- Starting point: Spanish BWR NPP → **M.2.1.4803**
- ✓ Detailed plant model
- ✓ MELCOR Best Modeling Practices (SOARCA, NUREG/CR-7008, 2014)

2. CORE modeling: OECD-BSAF project (CSN)

MELCOR 1.8.4.

1F1
1F2
1F3

	CORE & LP	RPV
COR	53	-
CVs	33	5
FLs	40	6

MELCOR 2.1.4803

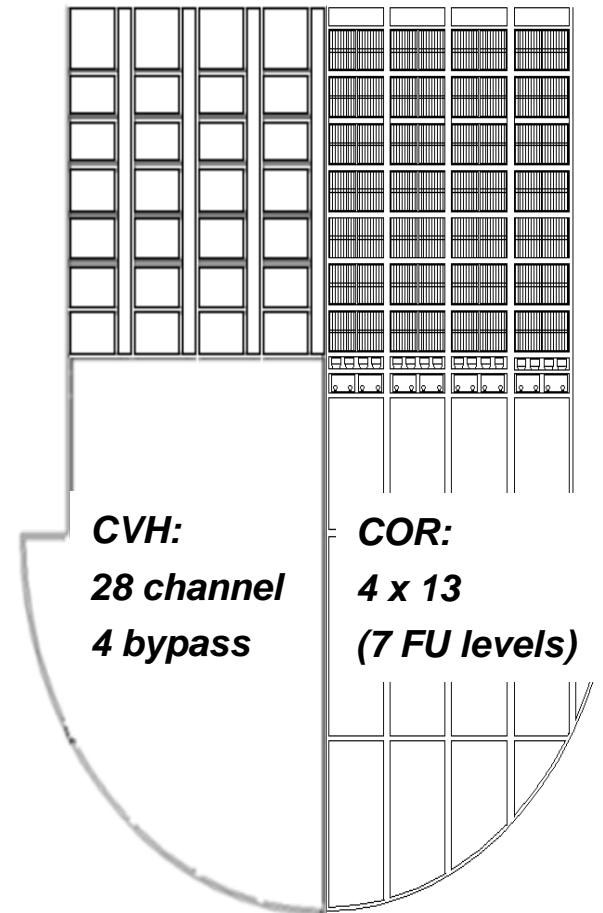

2. CORE modeling: BWR

Parametric Analyses:

- I. *Eutectic effect*
- II. *Fuel rod damage effect*
- III. *Horizontal flow effect*
- IV. *Channels effect*

MELCOR 2.1.4803

I. Eutectic effect

No eutectic model → Parametric model: new materials UO_2 -INT, ZrO_2 -INT & B_4C -INT
(↓ melting point)

Maximum fuel temperature

RPV pressure

- Lower maximum temperature
- Delayed RPV breach

II. Fuel Rod damage effect

MELCOR BPG SOARCA, 2014 → Thermal-mechanical weakening of the fuel rod (COR_ROD, TF)

Maximum fuel temperature

RPV pressure

- Lower maximum temperature
- Delayed RPV breach

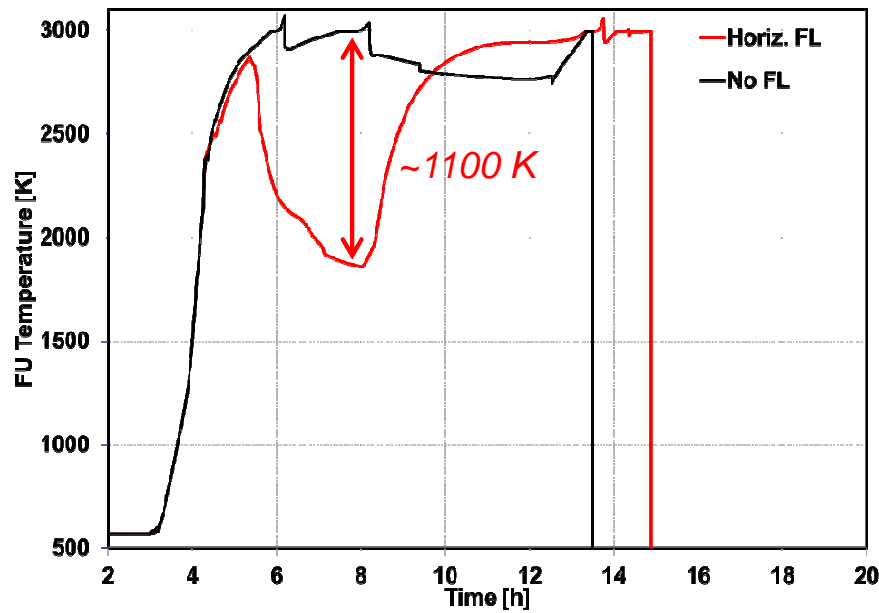

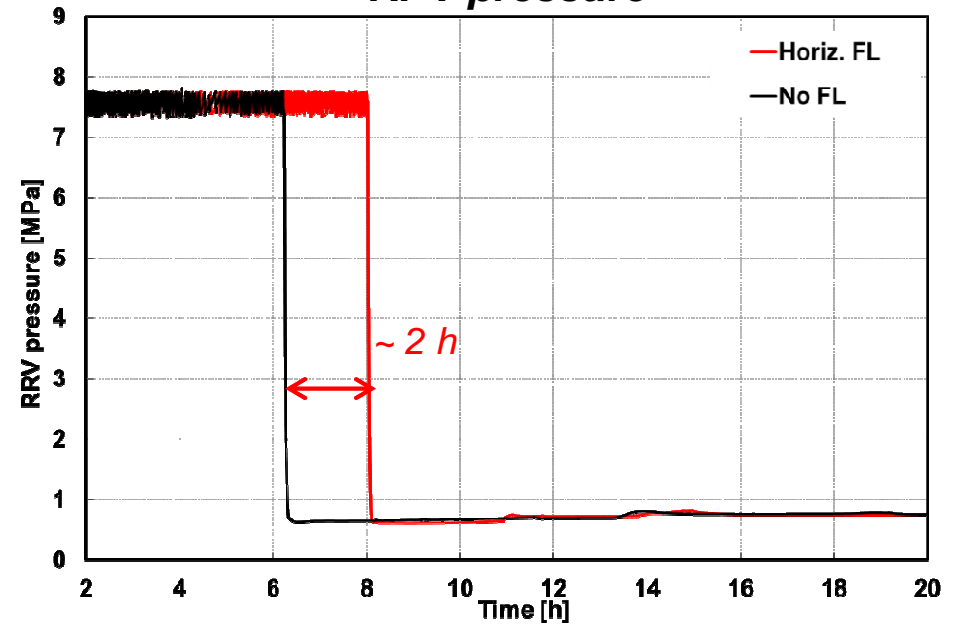

III. Horizontal Flow effect

Channel – Bypass connection by the channel box failure (FL_BLK channel-box)

Maximum fuel temperature

RPV pressure

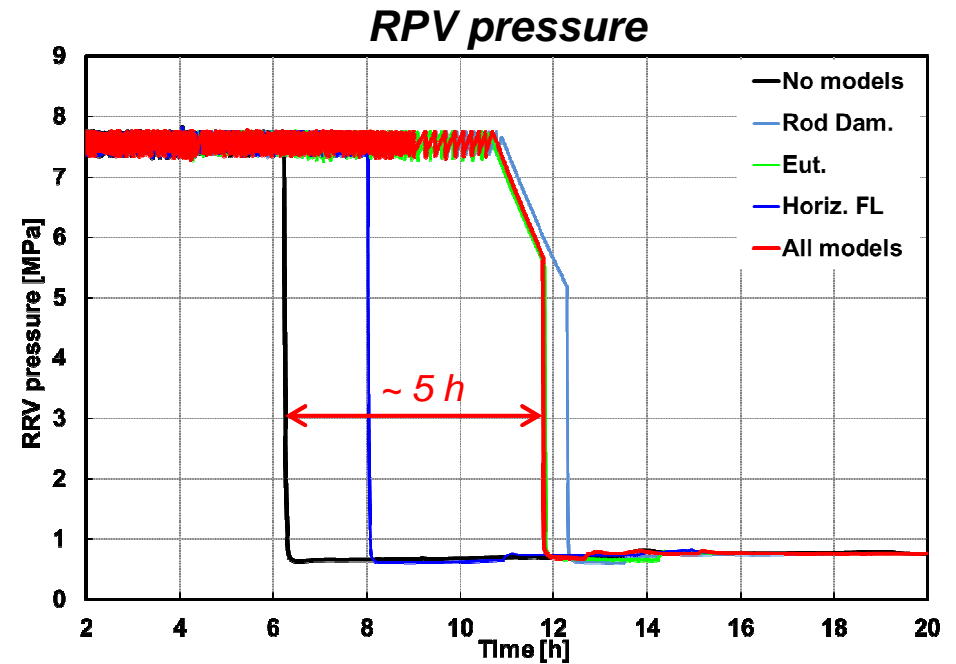

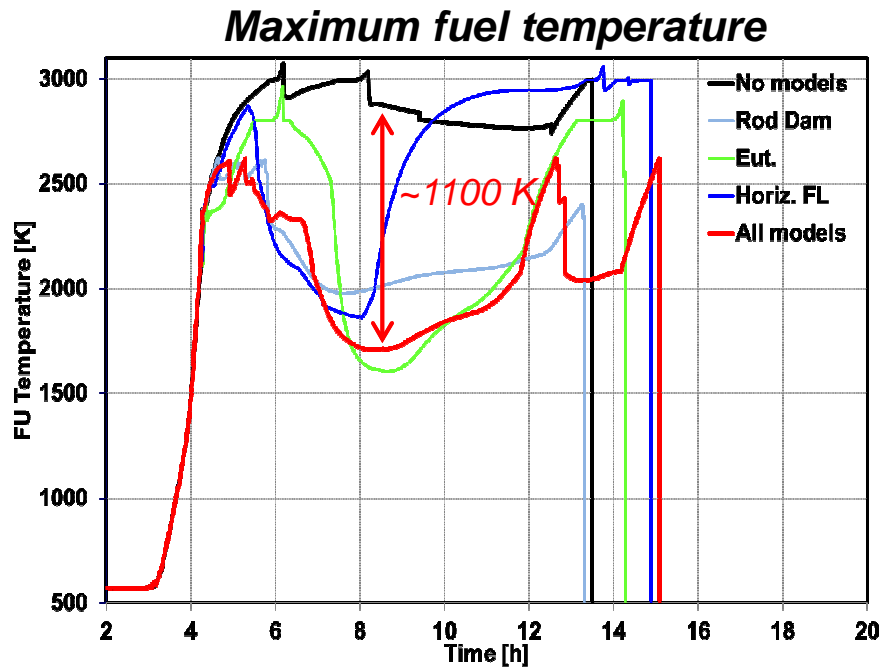

- Lower temperature
- Delayed RPV breach

→ Cumulative effect

- No cumulative effect
- Local differences in fuel degradation

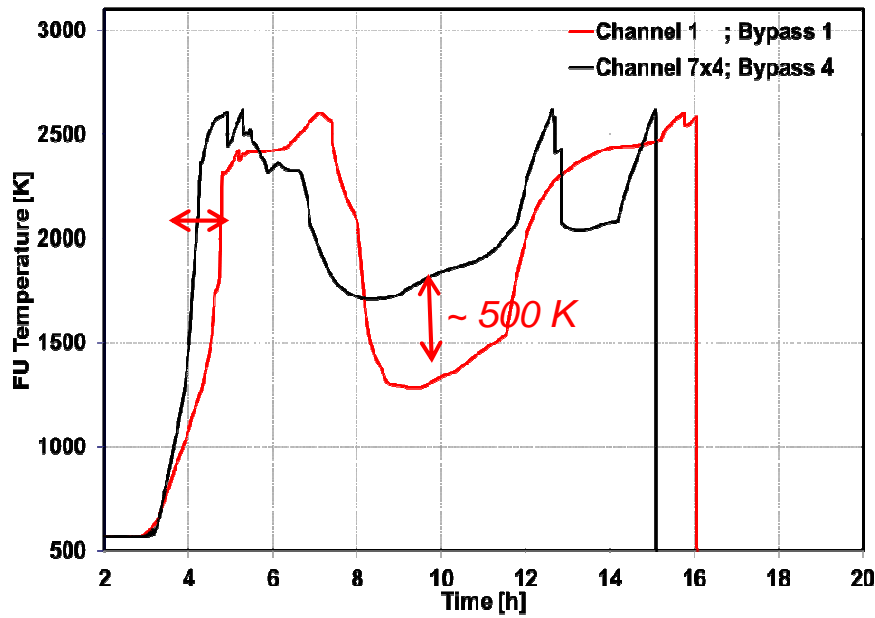

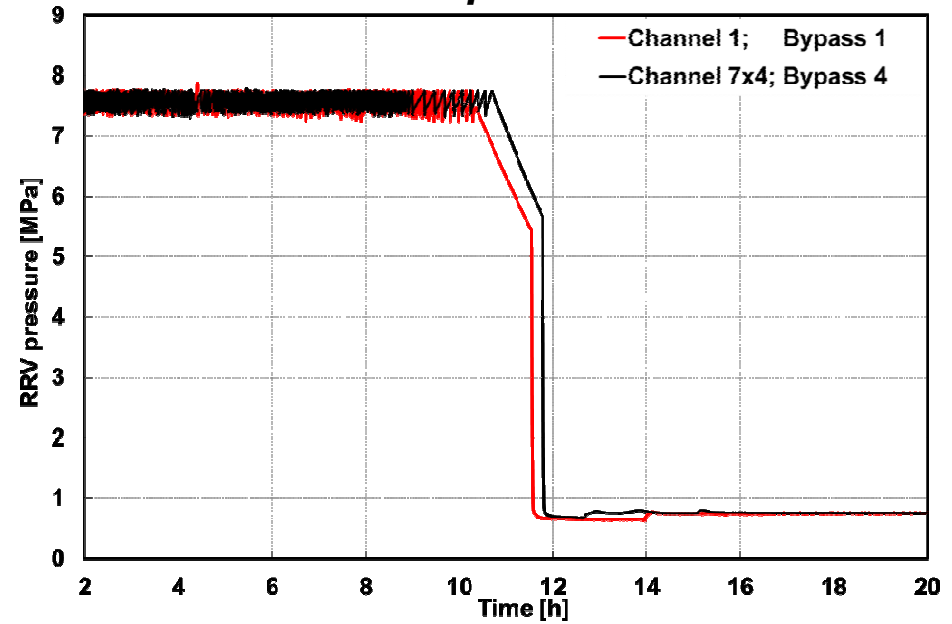

IV. Channel's effect

Increasing detail in hydrodynamic core description

Maximum fuel temperature

RPV pressure

- Similar behavior
- Delayed temperature profile
- No effect on RPV breach

3. PCV modeling: OECD-BSAF project (CSN)

Single-CV approach

1F1
1F2
1F3

	DW	WW	Vents
CVs	9	8	8
FLs	16	8	8

Multiple-CV approach

Modeling Cavity

(BPG SOARCA, 2014)

Modeling Cavity

Ex-vessel H₂ generation

~ 9.5 ton H₂

Source from RPV:

- Available metal:

Zr (13 ton) + SS (23.7 ton)

→ 1.5 ton of H₂

Source from Concrete:

- No re-bar

- Reduction concrete oxides

→ 2.5 ton of H₂

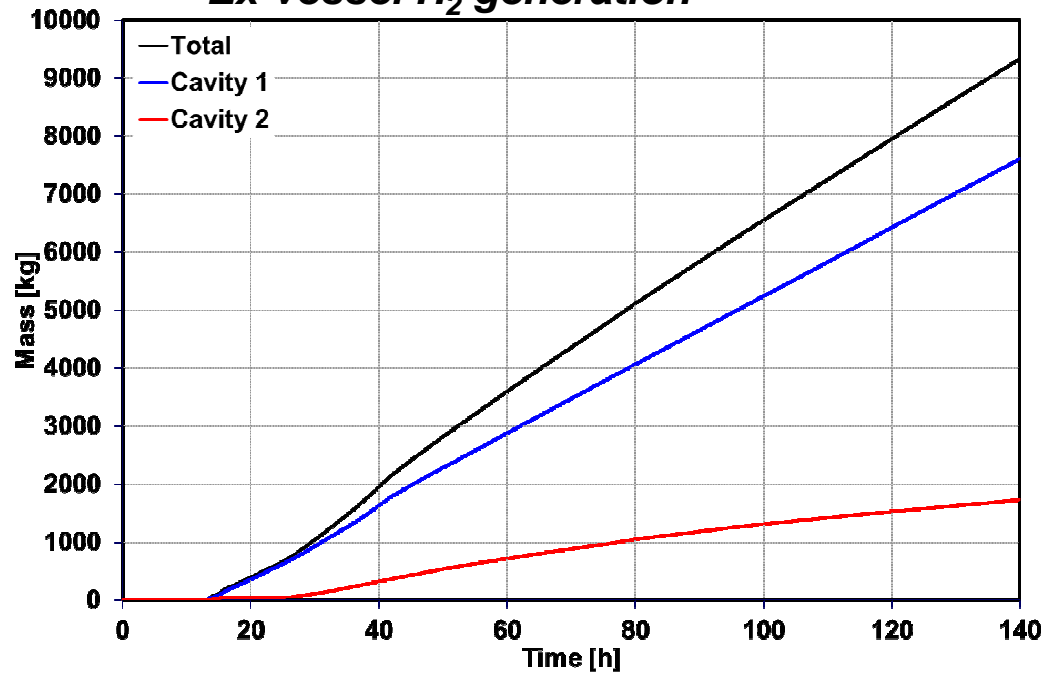

→ Source for 5.5 ton of H₂?

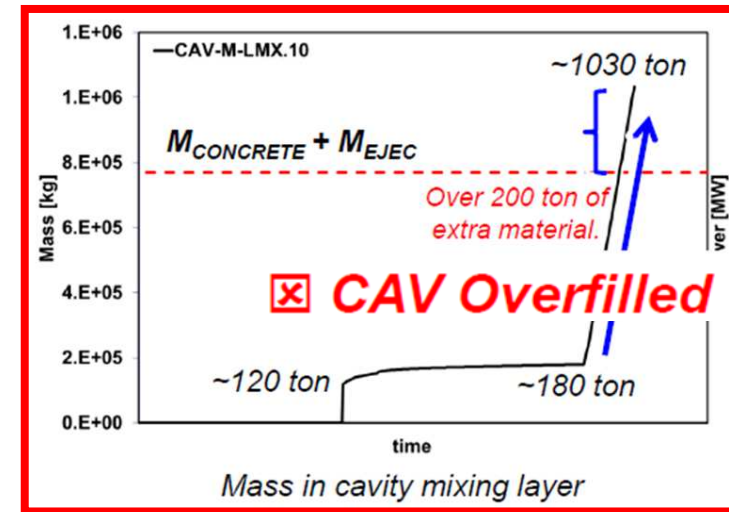

Modeling Cavity

Ex-vessel H₂ generation

→ Extra material into cavity?

EMUG, 2014:

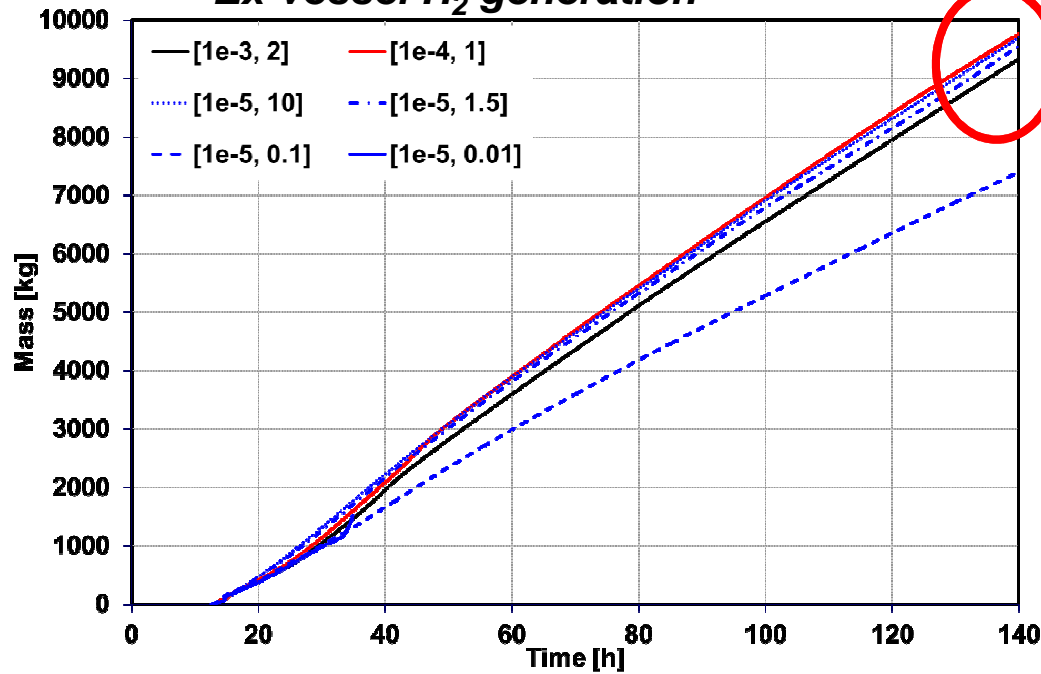

→ Source for 5.5 ton of H₂?

Modeling Cavity

Ex-vessel H₂ generation

9886 kg ± 307 kg H₂

Step time (s):

t _{min}	10 ⁻³	10 ⁻⁴	10 ⁻⁵
t _{max}	2	1	10
			1.5
			0.1
			0.01

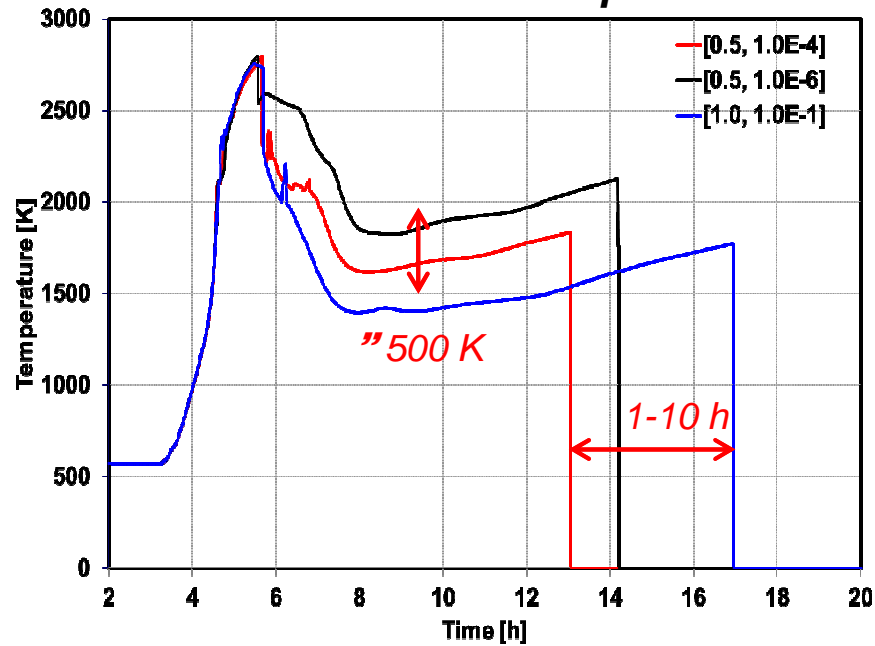

→ Numerical error?

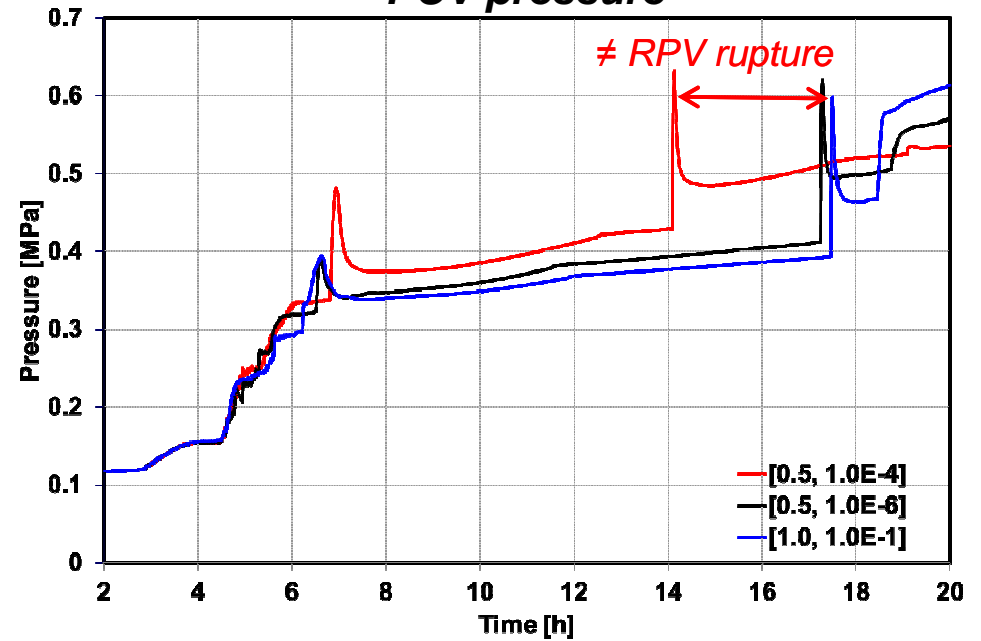

4. Numerical items: Time interval definition

Maximum fuel temperature

PCV pressure
